

Floating Functions in QUORION POS Systems

Floating means that all POS systems in a network have real-time access to certain information. Through this feature you can share guest checks in restaurants, open receipts, and new PLUs/articles. Floating allows freedom of movement for all users and customers within your business. This capability grants you substantial flexibility in how you run your operation and enhances efficiency.

FLOATING TABLES

Also known as **Guest Check Floating**, allows POS system to automatically transfer all sales data to all other terminals in the network - different locations such as tables, bar, or terrace. Consequently, staff is not limited to a specific POS system, when they need to enter orders.

New goodies available for sale.

FLOATING CLERKS

Consists of 2 components known as **Smooth ECR Change** and **Smooth Operator Change**. These ensure automatic clerk change and transfer of all active sales data per customer at any POS terminal in the network. It thereby facilitates direct POS access throughout your business such as bread sales, cake sections, or the delectable goodies area. Sales assistants continue serving clients simultaneously without interruption at any terminal. They simply swap to their open receipts at a touch of a button or a magnetic key.

FLOATING PLU

Newly created/changed PLU automatically passes from one terminal to all others. Clerk only needs to add it once.
